Sets

Maps

Conclusion

## Lecture topics

- Building one's collections is often not needed
- Most modern languages couple a standard library with the runtime
- In this lecture we shall list the various built-in collections of Python ( $\geq 3$ )

General idea

Tuples

Lists

Sets

Maps

Conclusion

## Introduction

- How do we represent collections of data in Python?
- What sort of collections are available?
- What properties does each collection offer?

Tuples

Lists

Sets

Maps

Conclusion

## Introduction

- Collections are not always straightforward **bags** of data
- Collections should be thought of as **bags with structure**

## Bags?

- A bag of data contains multiple values
- The size of the bag is usually variable
- Elements may be accessed via some dynamic mechanism
  - For example, *find the third element*

## Bags with structure?

- Structure of data refers to how data is stored
- There are **a lot** of possible structures of data
  - Lack of duplicates
  - Connections between values
  - Order-preservation
  - ...
- We cannot really cover them all, we shall just brush the surface and remind you of the existence of `www.google.com`

## Example structures we shall encounter

**Tuple** Fixed number of elements in a fixed order

**List** Dynamic number of elements in a fixed order

**Sets** Dynamic number of unique elements

**Maps** Dynamic number of unique keys mapped to  
non-unique values

## Example tuples - (THIS IS NOT CODE)

- A fixed number of values, kept in a fixed order
- (0,5)
- (1, 'Hello!')
- ('Hello!', 'World!', 100)

## Example lists - (THIS IS NOT CODE)

- A dynamic number of values, kept in a fixed order
- `[]`
- `[0; 5; 10; 20; 100; 20]`
- `[‘Hello!’; ‘World!’; 100]`

## Example sets - (THIS IS NOT CODE)

- A dynamic number of values, without specific order, and no duplicates
- $\{\}$
- $\{0; 5; 10; 20; 100\} = \{0; 5; 10; 20; 100; 20\}$
- $\{ \text{'Hello!'}; \text{'World!'}; 100 \}$

## Example maps - (THIS IS NOT CODE)

- A dynamic number of keys, each connected to its value<sup>a</sup>
- []
- [0  $\mapsto$  "John"; 1  $\mapsto$  "Jack";  $\mapsto$  "Jill"]

---

<sup>a</sup>The stack and the heap are maps!

# General idea

## Introduction

- Python offers a specific data structure for each of these containers
- These data structures are fast to write due to specialized syntax
- These data structures are fast to use due to internal optimizations

## Introduction

- Python offers a specific data structure for each of these containers
- These data structures are fast to write due to specialized syntax
- These data structures are fast to use due to internal optimizations
- These data structures are **not the only option**, sometimes you might need to build your own

## Description

- We will need to learn new syntax and new behaviours
- Keep in mind that this new syntax is not as essential as the basic syntax of Python
- This new batch of syntax is just aesthetics

## Description

- We will need to learn new syntax and new behaviours
- Keep in mind that this new syntax is not as essential as the basic syntax of Python
- This new batch of syntax is just aesthetics
- We could remove it and the language would not lose expressive power

Introduction

Problem  
discussion

General idea

Tuples

Lists

Sets

Maps

Conclusion

## Removing whole range

1

```
del a[:]
```

## Transforming a whole list (map)<sup>2</sup>

```
squares = list(map(lambda x: x**2, range(10)))
```

---

<sup>2</sup>Notice the `list` function that finalizes creation of the list.

## List comprehensions (**THIS IS NOT ACTUAL CODE!**)

```
1 [ <<element>> for <<i1>> in <<l1>> ... for <<iN>> in <<lN>> ... if <<COND>> ]
```

### Description

- For each value `i1` in list `l1`
- ...
- For each value `iN` in list `lN`
- If `COND` is true
- Add `element` to resulting list

Standard  
collections  
library

Introduction

Problem  
discussion

General idea

Tuples

Lists

Sets

Maps

Conclusion

## Building lists with list comprehensions, multiple iterators, and conditionals

```
1 [(x, y) for x in [1,2,3] for y in [3,1,4] if x != y]
```

## And a lot of other things...<sup>3</sup>

```
1 list.append(x) #Add an item to the end of the list
2 list.extend(L) #Extend the list by appending all the items in L
3 list.insert(i, x) #Insert an item at a given position
4 list.remove(x) #Remove the first item x from the list
5 list.pop([i]) #Remove the item at the given position in the list
6 list.clear() #Remove all items from the list
7 list.index(x) #Return the index in the list of the first x
8 list.count(x) #Return the number of times x appears in the list
9 list.sort(key=None, reverse=False) #Sort the items of the list in place
10 list.reverse() #Reverse the elements of the list in place
11 list.copy() #Return a shallow copy of the list
```

---

<sup>3</sup>Just be aware of their existence, learn them as you need!
